SESSION 2

Milestone 2

IDFinder Rwanda • Requirements engineering and system analysis

From a lost document to a verified return

Scope / Requirements / User stories / UML / Traceability

What the first release covers

Milestone 1 discussions identified recovery difficulty. The scenarios suggested specific workflow risks.

In scope

National IDs and driving licences

Found reports, public match search and private claims

Staff review and in-person return at a participating collection point

Outside this release

Issuing replacement documents

Government registry integration or automatic ownership decisions

Public display of document images, full ID numbers or contact details

Pilot assumption: a participating collection point can hold documents and verify claimants.

From a user need to an acceptance test

The example follows one requirement through to its observable outcome.

Design concern D2	Owners need a way to check whether a matching document was reported.
Requirement FR-02	The system shall filter approved found reports by document type, area and date range.
User story US-02	As an owner, I want to search found reports so I can identify a possible match.
Acceptance test T02	Given an approved matching report, when I search, then I see a masked result and its reference.

Reporting, search and claims

Each requirement describes behaviour the team can test.

FR-01	Must	The system shall accept a found report with document type, area and date, and issue a reference.
FR-02	Must	The system shall filter approved reports by document type, area and date range.
FR-03	Must	The system shall let an owner submit a private claim for an approved report.
FR-04	Must	The system shall display the current claim status to its authenticated owner.

Review, return and follow-up

Staff actions are restricted to the assigned collection point.

FR-05	**Must**	The system shall let assigned staff review, approve or reject found reports.
FR-06	**Must**	The system shall let assigned staff approve or reject a claim after checking ownership in person.
FR-07	**Must**	The system shall let assigned staff record one handover against an approved claim.
FR-08	**Should**	The system shall let a finder view whether their report is awaiting review, listed or closed.

Measurable targets for the pilot

These are proposed acceptance targets for testing.

NFR-01 Privacy	Public results expose only type, approximate area, date and reference. Inspect the UI and response payload.
NFR-02 Access	Unassigned staff and unrelated owners receive no claim details in negative access tests.
NFR-03 Performance	At least 95% of searches return within 2 seconds in 50 trials on a test set of 1,000 reports.
NFR-04 Accessibility	The core forms have visible labels, keyboard access and text contrast of at least 4.5:1.
NFR-05 Integrity	A second attempt to record handover is rejected and the original record stays intact.

User stories for finders and owners

MoSCoW priorities and Given / When / Then criteria

US-01 Must	As a finder, I want to report a found document. Given valid details, when I submit, then I receive a reference.
US-02 Must	As an owner, I want to find possible matches. Given a listed match, when I search, then I see a masked result.
US-03 Must	As an owner, I want to claim a match privately. Given a listed report, when I claim it, then staff receive the claim.
US-04 Must	As an owner, I want to check progress. Given my claim, when I open it, then I see its current status.

User stories for staff and follow-up

MoSCoW priorities and Given / When / Then criteria

US-05 Must	As staff, I want to screen reports. Given a pending report, when I approve it, then it becomes searchable.
US-06 Must	As staff, I want to review ownership. Given an in-person check, when I decide, then the claim status updates.
US-07 Must	As staff, I want to record return. Given an approved claim, when I confirm pickup, then the case closes.
US-08 Should	As a finder, I want to track my report. Given my reference and account, when I open it, then I see its status.

MoSCoW for the first release

The release centres on the path from reporting to verified return.

Must

US-01 to US-07. Core reporting, search, claims, review and handover.

Should

US-08. Finder report status after the core path works.

Could

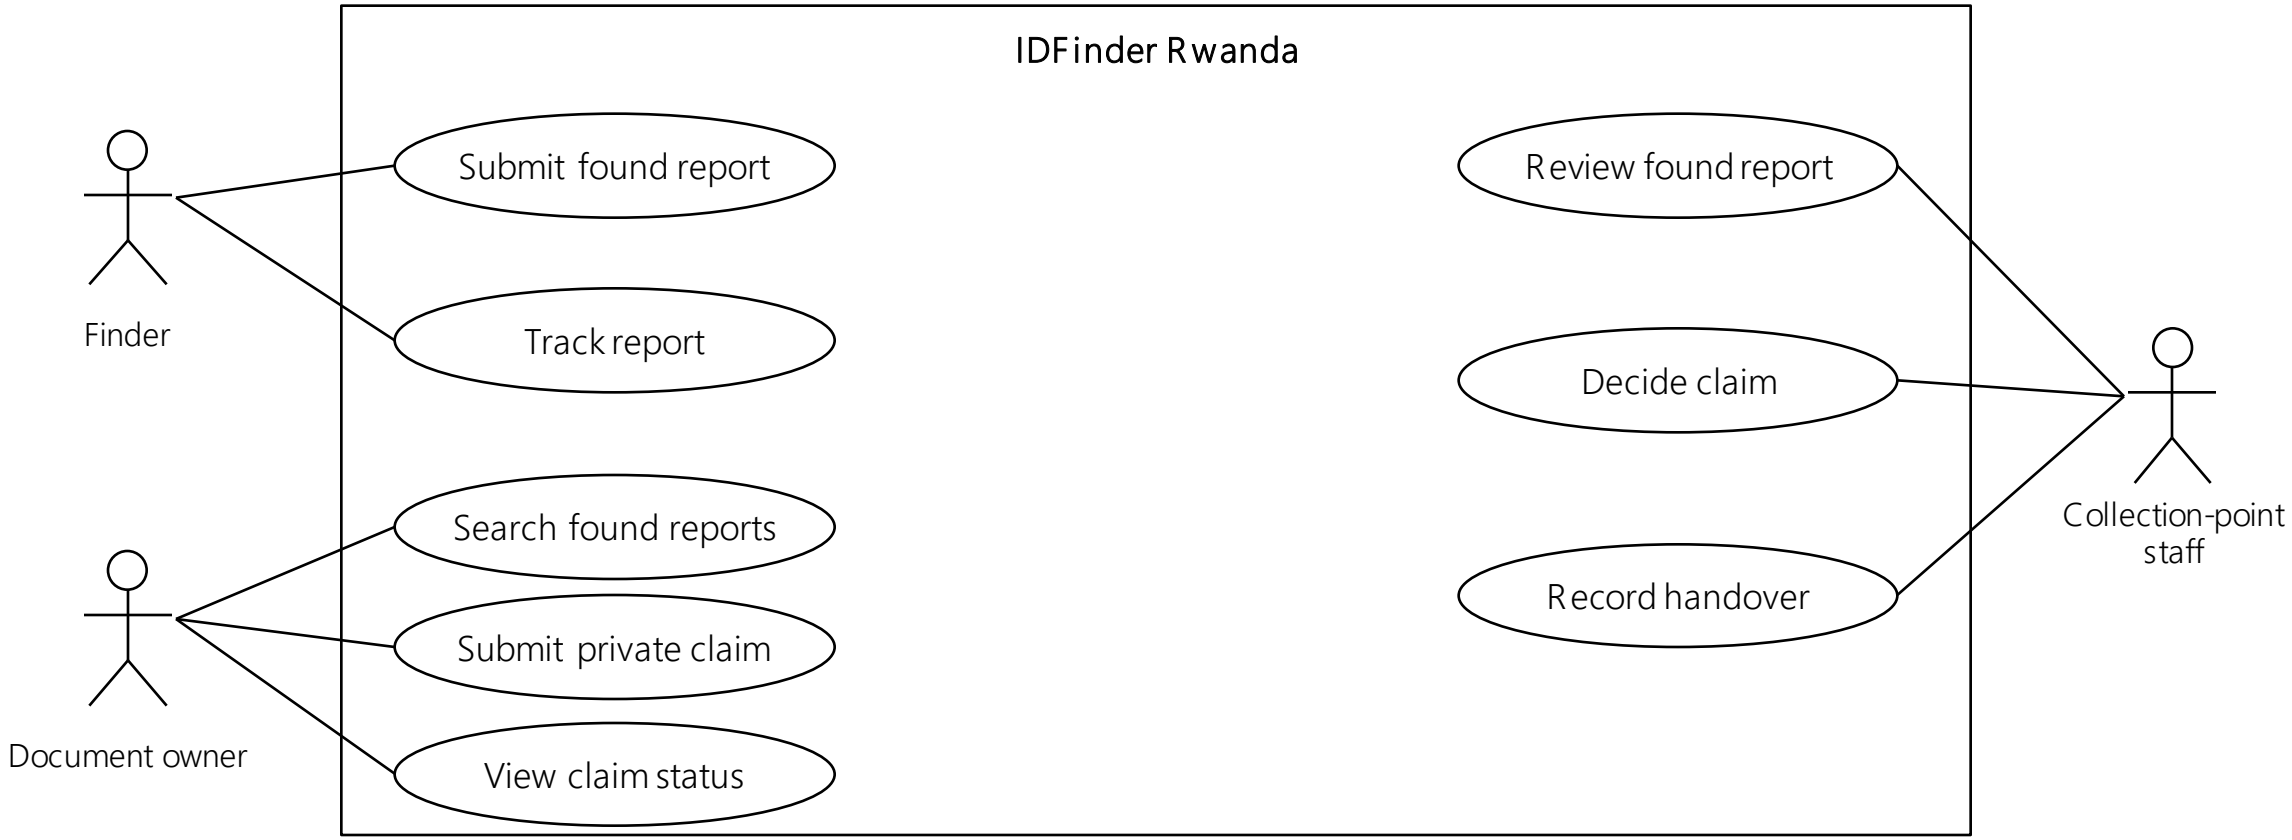

Optional status notifications with opt-in and no sensitive details.

Won't this release

Replacement issuance, registry integration and automatic verification.

IDFinder Rwanda system boundary

Actors remain outside the boundary. Solid lines show participation.

UC-01 Submit a found report

Primary actor: Finder • Requirements: FR-01 and FR-05

Precondition	The finder has signed in and has basic information about the document.
Main flow	The finder selects the type, area and date. The system validates the report and issues a reference.
Alternative flow	If required information is missing, the system marks the relevant fields and saves no report.
Outcome	The report awaits assigned staff review. Approval makes its masked listing searchable.

UC-02 Claim and collect

Primary actor: Document owner • Supporting actor: Collection-point staff

Precondition	The owner is signed in and has identified a possible match in an approved report.
Main flow	The owner submits a private claim. Staff check ownership in person and record their decision.
Alternative flow	If ownership cannot be verified, staff reject the claim. The document stays in custody.
Outcome	Staff record collection once after approval. The claim and listing close.

Design concerns, requirements and tests

D1–D5 are design concerns from discovery and scenario analysis.

D1 Reporting	FR-01 / US-01 / T01 valid submission. FR-05 / US-05 / T05 staff approval.
D2 Search	FR-02 / US-02 / T02 masked matching result.
D3 Private claims	FR-03 / US-03 / T03 private submission. FR-06 / US-06 / T06 staff decision.
D4 Return	FR-07 / US-07 / T07 single handover and duplicate rejection.
D5 Follow-up	FR-04 / US-04 / T04 owner status. FR-08 / US-08 / T08 finder status.

Two journeys for user validation

Validation plan for one document owner and one finder or collection-point worker.

Document owner

Review the masked search result and claim steps. Discuss what information would help identify a match and understand the claim status.

Finder or receiving staff

Review the report fields, custody steps and return record. Discuss who can verify ownership and how handover should be recorded.

Validation status: these are proposed requirements. No Milestone 2 user sessions were documented.

Course basis: SECD Session Introductions, slides 27–36.
