SESSION 1

IDFinder Rwanda

Lost and Found Identity Document Recovery System

What happens after someone loses an identity document?

MISIGARO Thomas

M04930/2025 • Engineering Lead

SIBOBUGINGO Leonidas

M04070/2025 UX and Product Lead

UNILAK Rwamagana Campus • Lecturer Yves Himbaza Mugiraneza • 4 November 2026

Five tests for our idea

Group 2 assessed the idea against the five discovery criteria.

Real	People consulted described document recovery as difficult.
Frequent	The frequency of document loss in the study area is unknown.
Painful	Possible burdens include search time, travel and interrupted activities.
Reachable	Rwamagana is the proposed area for reaching owners and finders.
Buildable	A small pilot could cover reporting, matching and verified return.

Five questions before designing

The five questions cover the search, the people involved and the outcome.

01 Search	Where did the owner look first?
02 Channels	Who did they contact and what did they learn?
03 Reporting	What did the finder do with the document?
04 Consequence	How much time, travel or effort did it take?
05 Handover	What happened before the document reached its owner?

Users shape each milestone

Discovery comes first. The lecturer approves each stage.

1 Discovery

Learn what happens today

2 Requirements

Specify what users need

3 Design

Prototype and review

4 Implementation

Build the core journeys

5 Evaluation

Test with real users

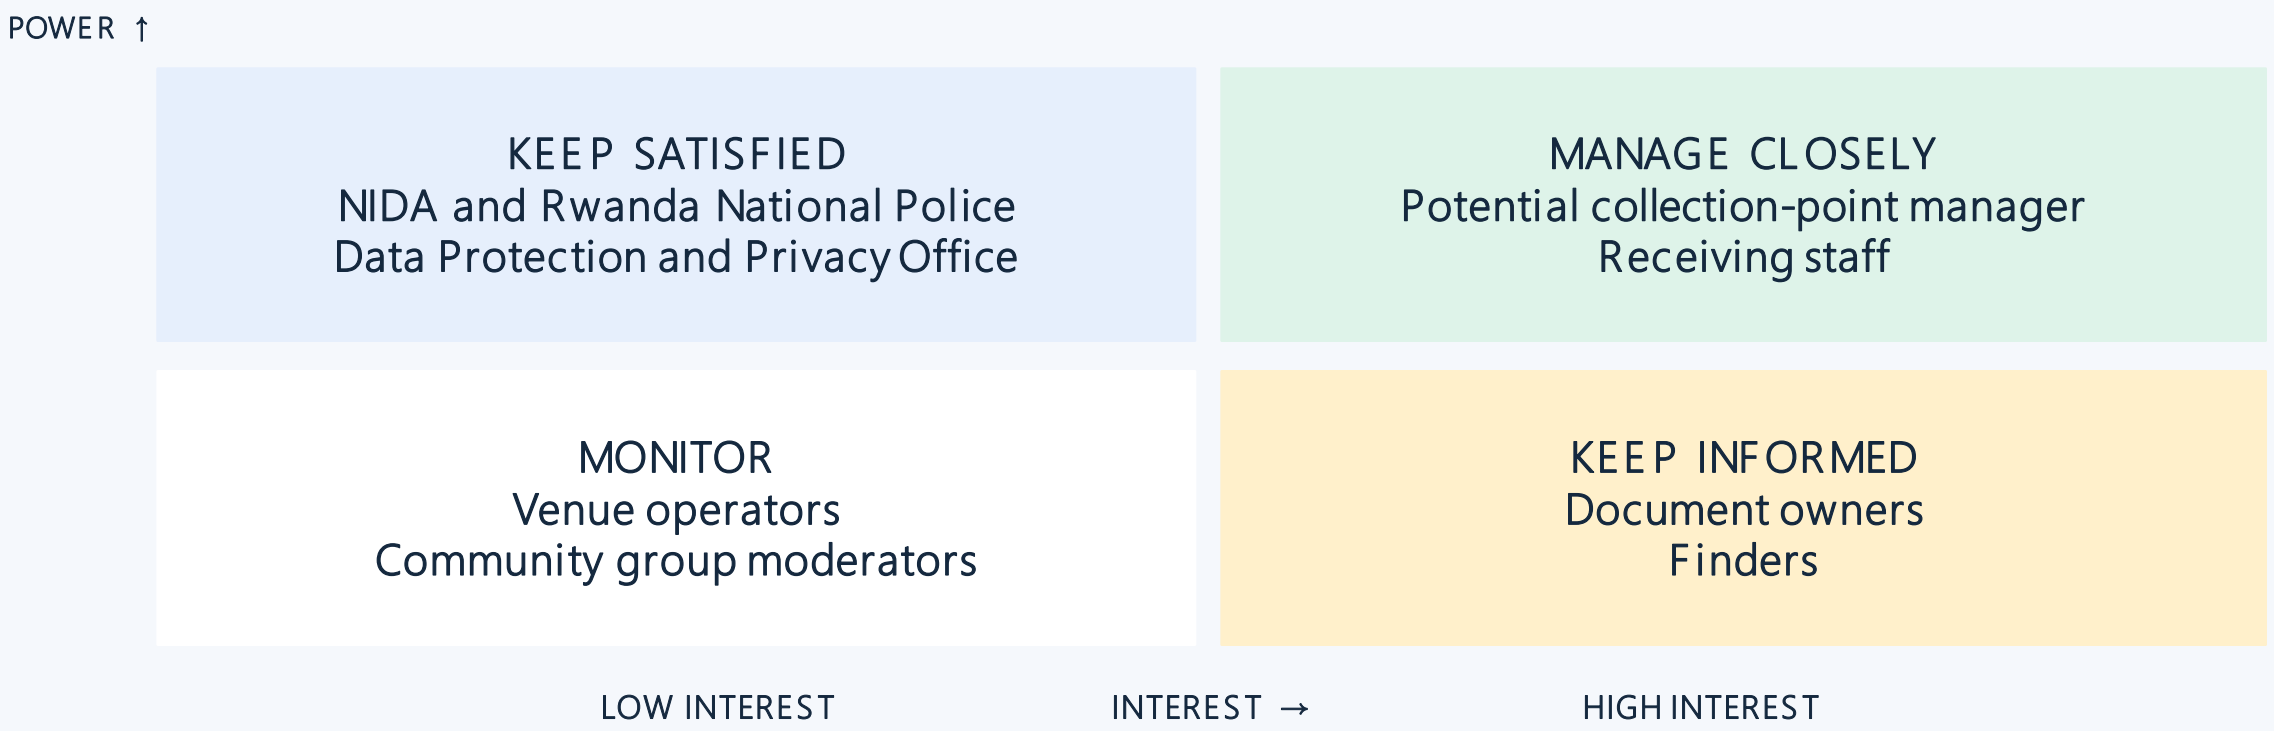

6 Defence

Demonstrate and explain

Coding starts in Milestone 4 after the design is approved.

Stakeholder power and interest

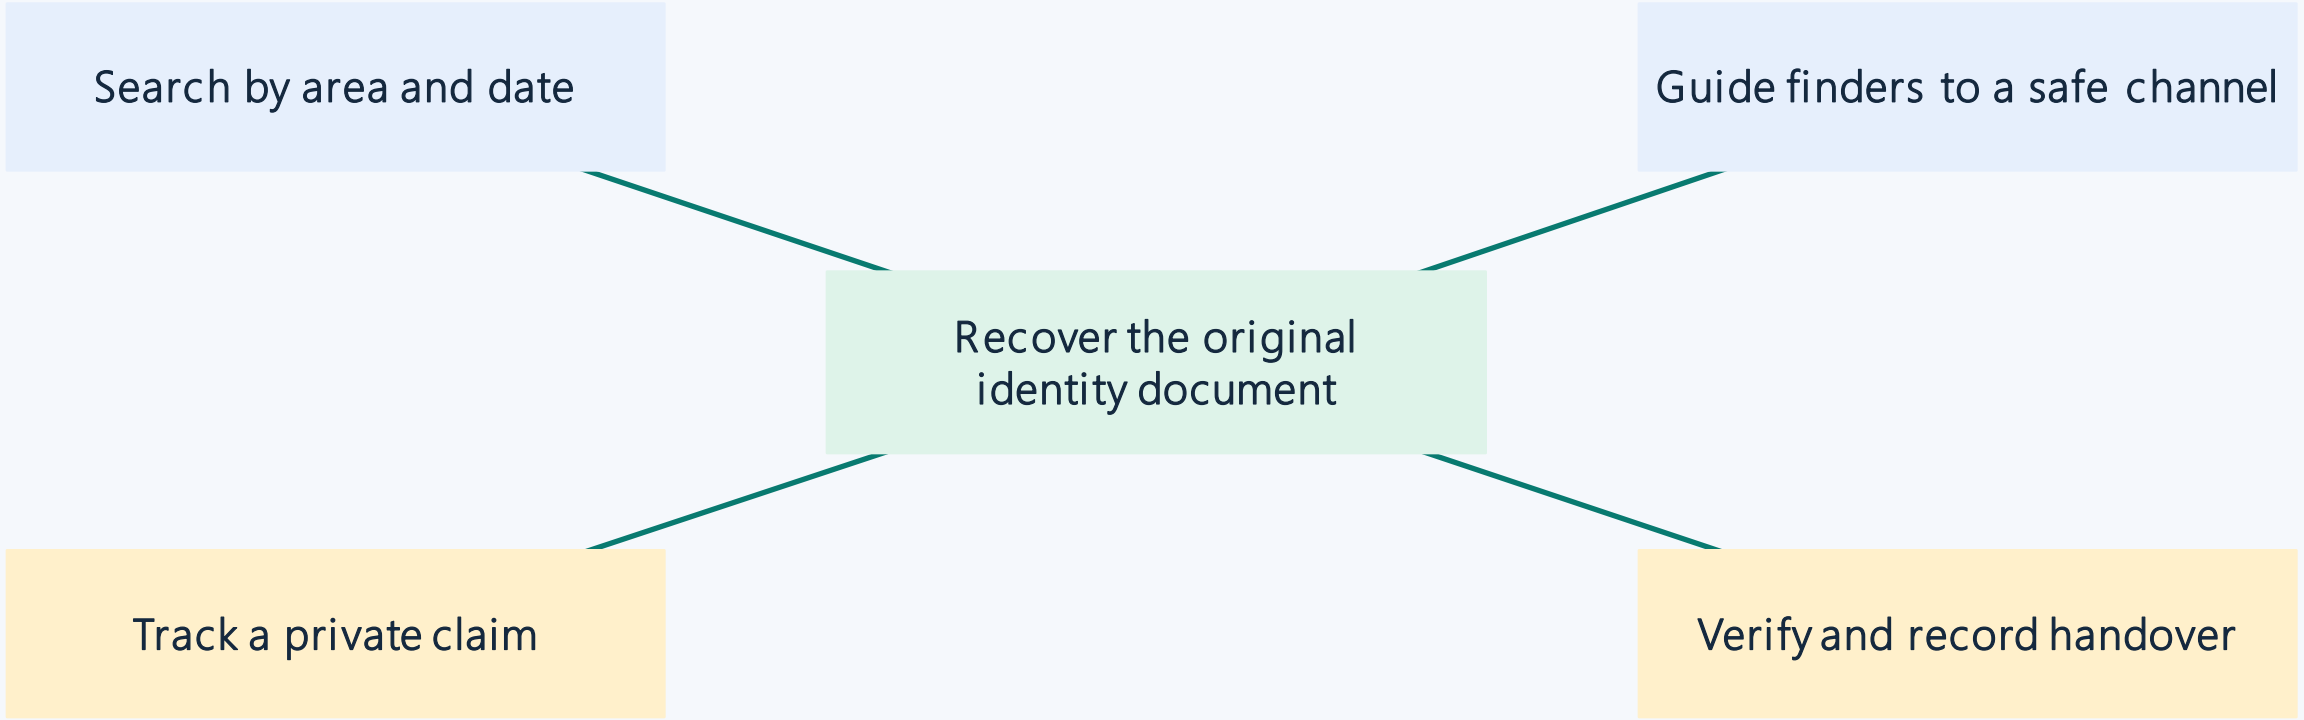

Proposed positions for the discovery interviews.

Owners and finders are the primary users. Receiving staff would handle custody and handover.

Brainstorming board

The team identified four options for recovering an original document.

The options address discovery, reporting, follow-up and return.

Interview approach

The interview guide follows one incident from discovery to outcome.

Opening question

Tell me about the last time you lost or found a document. What did you do first?

Follow-up questions

Why did you choose that channel?
Tell me more about what happened next.

Consent and privacy

The protocol covers informed consent, permission for notes and participant codes. It excludes document numbers and photos.

National ID owner

Fictional walkthrough • Scenario facilitator: MISIGARO Thomas

INTERVIEW QUESTION	ILLUSTRATIVE RESPONSE
When did you realise the ID was missing?	I noticed when I needed to show it.
Where did you look first? Why?	I returned to the last place I remembered using it.
Tell me more about what happened there.	I asked staff whether anyone had left it with them.
How did the search end?	I checked nearby but could not tell whether it had been found.

Scenario analysis based on a fictional incident.

Driving licence owner

Fictional walkthrough • Scenario facilitator: SIBOBUGINGO Leonidas

INTERVIEW QUESTION	ILLUSTRATIVE RESPONSE
What happened the last time you lost your licence?	I noticed after returning from a trip.
Who did you contact first? Why?	The people I travelled with knew where I had stopped.
Tell me more about the hardest step.	I had to repeat the story to each new person I asked.
What did you do in the end?	I stopped searching and considered applying for a replacement.

Scenario analysis based on a fictional incident.

Finder of an identity document

Fictional walkthrough • Scenario facilitator: MISIGARO Thomas

INTERVIEW QUESTION	ILLUSTRATIVE RESPONSE
Tell me about the last time you found an ID.	I found a card near a shop.
What did you do first? Why?	I asked the shop worker because the owner might return there.
Tell me more about what you shared.	I described the card without posting its number.
How did you learn the outcome?	I left it with the worker and did not hear what happened next.

Scenario analysis based on a fictional incident.

Screening and consent

The first section records consent and checks whether the incident fits the study.

IDFinder Rwanda | Discovery interview

Do you agree to take part? * — Multiple choice

◯Yes ◯No → end form

May we take anonymised notes? * — Multiple choice

◯Yes ◯No

What was your role in the last incident? * — Multiple choice

◯Owner ◯Finder ◯Receiving staff ◯No direct experience → end form

Which document was involved? * — Multiple choice

◯National ID ◯Driving licence ◯Other

The form design excludes email collection. Audio recording requires separate consent.

Incident details

The second section captures the sequence, the hardest step, the effort and the outcome.

IDFinder Rwanda | Discovery interview

What happened the last time? *

Paragraph

Describe the steps in order.

Which step was hardest? Why? *

Paragraph

Tell me more about what happened at that step.

What effort did it take?

Paragraph

Time, trips, calls or expenses the participant remembers.

What was the outcome? *

Paragraph

Recovered, returned, replaced, still missing or unknown.

Private record: participant code, date, role, language, consent and exact wording.

Affinity map and candidate pain points

Green summarises the informal discussions. Yellow groups themes from the illustrative scenarios.

People consulted described document recovery as difficult.

SEARCH
ID owner scenario
Unsure where to check

REPORTING
Finder scenario
Unsure where to leave it

EFFORT
Licence owner scenario
Repeated explanations

PRIVACY
Finder scenario
Unsure what to share

FOLLOW-UP
Finder scenario
Return outcome unknown

What the map shows

The scenarios illustrate uncertainty at five points, from the first search to confirmation of return.

Owner and finder profiles

These profiles summarise the needs illustrated in the scenarios.

Document owner

Goal: Find out whether the original was found.

Current approach in the scenario: Return to familiar places and ask contacts.

Main frustration: No clear way to know whether the document was found.

Finder

Goal: Return a document through a trusted channel.

Current approach in the scenario: Leave the document with staff near the place it was found.

Main frustration: The finder does not learn whether the owner collected it.

Three recovery routes

The comparison considers what each route can offer and where uncertainty can arise.

Physical handover	A local handover can preserve the original. The owner still needs to know where it was left.
Community messaging	A community alert can reach nearby contacts. Its reach and follow-up depend on the group.
Official replacement	Replacement can restore access to a valid document. It serves a different goal from retrieving the original.

Comparison scope

These are general recovery routes. The comparison makes no claims about official fees, processing times or prevalence.

The recovery problem

The statement separates the reported difficulty from possible explanations and effects.

User group	People in Rwanda who lose a national ID or driving licence.
Struggle	They may have difficulty recovering the original document.
Root cause	Unclear search, reporting or handover channels are a possible explanation.
Consequence	A search may involve extra time, calls or trips. The team has no measured estimate.
Evidence	People consulted in informal discussions described recovery as difficult.

Discovery conclusion

The proposed pilot addresses uncertainty between finding a document and returning it.

Proposed direction

A finder submits a limited report. The owner checks for a possible match and submits a private claim. A confirmed collection point verifies ownership and records the handover.

Basis for the proposal

The informal discussions identified a broad recovery difficulty. The scenarios helped the team explore how search, reporting and handover could work. The proposed pilot focuses on the original document and a private claim process.

Course basis: Project Guide, pp. 2–9 and 16–18. SECD Session Introductions, slides 16–26.
